

## Title of your paper

This is where you introduce the topic to the reader and why it is important to study. In the next section, describe previous studies on this topic. This would be called the literature review section. Then you will present some broad research questions pertaining to your topic. After the questions, state each of your current study's hypotheses and the rationale for each.

## Method

### *Participants*

Describe participants' age, gender, and or ethnicity. Also, how you sampled these participants and where they were recruited.

### *Materials*

Describe the survey or items used for your study and place in the appendix (See Appendix A).

### *Procedures*

Describe how you approached participants, got consent, and administered the procedure. How long did the procedure/survey take? Describe any debriefing procedures.

## Results

Using APA-style statistical format, describe each statistical test for each of your study's hypotheses. Describe if the results do or do not support your hypotheses.

## Discussion

Restate your hypotheses and whether the results supported them or not (do not restate data, just say in a sentence or two). Interpret what it means. Next, describe any limitations to your study (think about how it could have been done better) and how they could have affected your findings. Finally discuss what the future directions are for this area of research.
